Master Functional Skills	Model Solutions (MFS)

Pearson Edexcel Functional Skills

Centre Number	Candidate Number
MFS-UK	L2-JUL18

Mathematics

Level 2

16 – 20 July 2018
Time: 1 hour 30 minutes

Paper Reference
FSM02/01

You must have:
Pen, calculator, HB pencil, eraser, ruler graduated in cm and mm, protractor, compasses.

Total Marks
48 /48

My signature confirms that I will not discuss the content of the test with anyone until the end of the 5 day test window.

Signature: Master Functional Skills (MFS)

Instructions

- Use a **black** ball-point pen.
- **Fill in the boxes** at the top of this page with your name, centre number and candidate number.
- Sign the declaration.
- Answer **all** questions.
- Answer the questions in the spaces provided
  – there may be more space than you need.
- **Calculators may be used.**

Information

- The total mark for this paper is 48.
- The marks for each question are shown in brackets
  – use this as a guide to how much time to spend on each question.
- **You must show clearly how you get your answers because marks will be awarded for your working out.**
- **Check your working and your answers at each stage.**
- **This sign shows where marks will be awarded for showing your check.**

Advice

- Read each question carefully before you start to answer it.
- Keep an eye on the time.

MASTER FUNCTIONAL SKILLS

ONLINE LEARNING PLATFORM & ACCREDITED COURSES

Pearson Edexcel & Open Awards Accredited Suite · Entry 3, Level 1 & Level 2

Pass Your Functional Skills Exams With Confidence

100% Pass Guarantee | Dyslexia-Friendly Learning | 1-to-1 Expert Tutor Support

Master Functional Skills provides an adaptive, dyslexia-friendly online learning platform tailored for adult learners, apprentices, and healthcare & vocational staff. Everything you need to revise, practice, and pass is at your fingertips.

1. Smart Diagnostic Initial Assessment

Calculate your exact working level and pinpoint knowledge gaps instantly

- **Exact Grade Calculation:** Adaptive assessments calculate your exact level across all topics.
- **Personalised Study Pathway:** Skip what you know; focus 100% on the topics needed to pass.
- **Real-Time Exam Readiness:** Predictive tracker confirms when you are 100% ready to book.

2. Comprehensive Video Lessons & Worked Solutions

Bite-sized visual explainers covering every single Maths & English curriculum standard

- **Step-by-Step Video Lessons:** Master percentages, algebra, perimeter, ratio, and reverse fractions.
- **Multi-Ink Handwriting Models:** Visual 3-colour methods showing working, carries, and examiner tips.
- **Tutor Shortcuts & Golden Rules:** Proven non-calculator mental arithmetic hacks and BIDMAS tricks.

3. Full Mock Exams & Real-Time Performance Analytics

Practice in exam conditions and watch your scores and confidence climb

- **Authentic Exam Papers:** Timed Section A & Section B papers formatted exactly like Pearson Edexcel.
- **Instant Topic Breakdown:** View percentage scores across Number, Measure/Shape, and Data.
- **Historical Score Tracking:** Monitor past attempts to ensure continuous improvement before exam day.

Ready to Master Your Functional Skills & Pass First Time?

Join thousands of healthcare staff, apprentices, and adult learners across the UK.

Instant 24/7 access on desktop, tablet, and mobile with no software to install.

START LEARNING TODAY AT

MasterFunctionalSkills.co.uk

SECTION A: Railway

Answer all questions in this section.

Write your answers in the spaces provided.

1 Petra works for a train company.
She writes a report for her manager.

The table shows the number of passengers who used a train station last week.

	Mon	Tue	Wed	Thu	Fri	Sat	Sun
Number of passengers	29 500	28 700	23 100	21 800	29 400	20 700	13 400

(a) Work out the mean daily number of passengers who used the train station last week.
Show a check of your working. **(3)**

Use the box below to show clearly how you get your answer.

Step 1: Calculate total weekly passengers by summing all 7 days *[M1 sum]*

Total = 29,500 + 28,700 + 23,100 + 21,800 + 29,400 + 20,700 + 13,400

Total = 166,600 passengers

Step 2: Divide total by 7 to calculate the mean daily passengers *[M1 mean]*

Mean Daily = 166,600 ÷ 7 days = 23,800 passengers

Daily passenger breakdown check:

- Weekdays (Mon–Fri) = 132,500 passengers (mean = 26,500/day)
- Weekend (Sat–Sun) = 34,100 passengers (mean = 17,050/day)
- **Overall Mean = 23,800 passengers/day [A1]**

Use the box below to show your check.

☑

Reverse multiplication check: *[B1 check]*

23,800 × 7 = 166,600 passengers (matches total)

166,600 – 13,400 (Sun) = 153,200 (matches Mon–Sat total) (correct)

DO NOT WRITE IN THIS AREA

DO NOT WRITE IN THIS AREA

DO NOT WRITE IN THIS AREA

Petra also has this information about the arrival times of trains last week.

Arrival times	on time	up to 10 minutes late	more than 10 minutes and up to 30 minutes late	more than 30 minutes late
Number of trains	287	54	17	5

The train company has a target

98% of trains must arrive no more than 10 minutes late.

(b) Was the target met last week?
Show why you think this. **(3)**

Use the box below to show clearly how you get your answer.

Step 1: Calculate total number of trains last week *[M1 total]*

Total Trains = 287 + 54 + 17 + 5 = 363 trains

Step 2: Find trains arriving ≤ 10 mins late (on time + up to 10m late) *[M1 on-time]*

Punctual Trains = 287 + 54 = 341 trains (≤ 10 mins late)

Step 3: Calculate percentage of trains meeting punctuality standard *[M1 percent]*

Percentage = (341 ÷ 363) × 100 = 93.939...% ≈ 93.9%

Step 4: Compare with company target (98%)

93.9% < 98% (short of target by 98% − 93.9% = 4.1%)

Alternative check using number of trains:

- **98% of 363 = 0.98 × 363 = 355.74 trains needed**
- **Only 341 trains met standard (341 < 356) (correct)**

No, target NOT met: 93.9% < 98% *[A1 decision]*

(Total for Question 1 is 6 marks)

DO NOT WRITE IN THIS AREA
DO NOT WRITE IN THIS AREA
DO NOT WRITE IN THIS AREA

2 Mo manages track repairs.
He needs to order 60 tonnes of stones for a track repair.

The stones are sold in full cuboid containers.
A full container of stones is 80 cm by 80 cm by 70 cm.

Mo knows that

- 1 m^3 of the stones weighs 1.8 tonnes
- each container of stones costs £45.16

Mo wants to order the smallest number of containers of stones as possible.

Work out the total cost of the containers of stones Mo needs to order.

(6)

Use the box below to show clearly how you get your answer.

Step 1: Convert container dimensions from centimetres to metres *[M1 units]*

- **80 cm = 0.8 m and 70 cm = 0.7 m**

Step 2: Calculate the volume of one cuboid container *[M1 volume]*

Volume = length × width × height

Volume = 0.8 m × 0.8 m × 0.7 m = 0.448 m^3

Step 3: Calculate weight of stones per container (1 m^3 = 1.8 tonnes) *[M1 weight]*

Weight = 0.448 m^3 × 1.8 t/m^3 = 0.8064 tonnes

Alternative approach for total volume needed:

- **Total volume for 60 tonnes = 60 ÷ 1.8 = 33.333... m^3**
- **Containers = 33.333... m^3 ÷ 0.448 m^3 = 74.404... containers**

(Containers needed and total cost continue on next page -->)

DO NOT WRITE IN THIS AREA
DO NOT WRITE IN THIS AREA
DO NOT WRITE IN THIS AREA

Step 4: Calculate exact number of containers required for 60 tonnes [M1 containers]

Containers = 60 ÷ 0.8064 = 74.4047... containers

Step 5: Determine smallest whole number of full containers to order [M1 round up]

Stones are only sold in full containers:

Mo must round UP: 74.404... --> 75 whole containers

Step 6: Calculate total cost of 75 containers (£45.16 each) [M1 cost]

Total Cost = 75 containers × £45.16 = £3,387.00

Verification & Sanity Check:

- 75 containers: 75 × 0.8064 = 60.48 t (≥ 60 t required) (correct)
- 74 containers: 74 × 0.8064 = 59.67 t (< 60 t, not enough)

Total Cost of Containers = £3,387 [A1]

(Total for Question 2 is 6 marks)

DO NOT WRITE IN THIS AREA

DO NOT WRITE IN THIS AREA

DO NOT WRITE IN THIS AREA

3 There is a high-speed rail track between London and Manchester.

The length of this track is 210 miles.

A train departs London at 11:20 and arrives in Manchester at 13:28

The train company claims

the average speed of this train is 104 miles per hour.

Is the average speed of this train 104 miles per hour?

(4)

Use the box below to show clearly how you get your answer.

Step 1: Calculate the journey time from 11:20 to 13:28 *[M1 time]*

- 11:20 to 13:20 = 2 hours = 120 minutes
- 13:20 to 13:28 = 8 minutes

Total Journey Time = 2 hours 8 minutes = 128 minutes

Step 2: Convert journey time to decimal hours (divide minutes by 60) *[M1 hours]*

Time = 128 mins ÷ 60 = 2.1333... hrs (= 2 2/15 hrs)

Step 3: Calculate actual average speed (Speed = Distance ÷ Time) *[M1 speed]*

Average Speed = 210 miles ÷ 2.1333... hrs = 98.44 mph

Step 4: Compare with the claimed speed (104 mph)

98.44 mph < 104 mph (actual speed is ~5.6 mph slower than claimed)

Conclusion & Decision:

No, average speed was 98.4 mph (< 104 mph). *[A1 decision]*

(Alternative check methods shown on next page -->)

DO NOT WRITE IN THIS AREA

DO NOT WRITE IN THIS AREA

DO NOT WRITE IN THIS AREA

Alternative Verification Method 1 (Expected time at 104 mph): *[B1 check]*

- Time needed = 210 miles ÷ 104 mph = 2.0192... hours
- 2.0192... hours = 2 hours 1.15 minutes ≈ 121 minutes
- Actual time taken was 128 minutes (> 121 minutes) --> Too slow! (correct)

Alternative Verification Method 2 (Distance covered at 104 mph in 128 mins):

- Distance = 104 mph × 2.1333... hours = 221.87 miles
- 221.87 miles > 210 miles (at 104 mph, train would travel further) (correct)

(Total for Question 3 is 4 marks)

DO NOT WRITE IN THIS AREA

DO NOT WRITE IN THIS AREA

DO NOT WRITE IN THIS AREA

SECTION B: Electrical company

Answer all questions in this section.

Write your answers in the spaces provided.

4 Josh is a product designer for an electrical company.
He designs a new table lamp.

Josh will use plastic to make the lamp.

He uses this formula to work out the amount of plastic needed.

$$P = b^2 + 2bh$$

where

P is the amount of plastic needed (cm^2)
b is the length of the base (cm)
h is the slope height (cm)

The length of the base of the lamp will be 13 cm.
The slope height of the lamp will be 34 cm.

Josh thinks the amount of plastic needed will be less than 1000 cm^2

(a) Is Josh correct?
Show why you think this. **(3)**

Formula: $P = b^2 + 2bh$ where $b = 13$ cm, $h = 34$ cm

(Full step-by-step substitution and evaluation shown in box on Page 9 -->)

DO NOT WRITE IN THIS AREA

DO NOT WRITE IN THIS AREA

DO NOT WRITE IN THIS AREA

Use the box below to show clearly how you get your answer.

Step 1: Calculate the area of the square base (b^2 where $b = 13$ cm) [M1 base]

Base Area = b^2 = 13^2 = 13 × 13 = 169 cm²

Step 2: Calculate the lateral area ($2bh$ where $b = 13$ cm, $h = 34$ cm) [M1 lateral]

Lateral Area = 2 × b × h = 2 × 13 × 34

Lateral Area = 26 × 34 = 884 cm²

Step 3: Calculate total amount of plastic needed ($P = b^2 + 2bh$) [M1 total P]

P = 169 + 884 = 1,053 cm²

Step 4: Compare total plastic needed with Josh's claim (< 1000 cm²)

1,053 cm² > 1,000 cm² (exceeds 1,000 cm² by 53 cm²)

Conclusion & Decision:

No, Josh is NOT correct. [A1 decision]

The lamp requires 1,053 cm² of plastic, which exceeds 1,000 cm².

Reverse check:

- **1,053 − 169 = 884**
- **884 ÷ 26 = 34 cm (matches slope height h) (correct)**

DO NOT WRITE IN THIS AREA

DO NOT WRITE IN THIS AREA

DO NOT WRITE IN THIS AREA

Josh wants to make the lamp purple.
He will use dye to make the plastic purple.

Josh will mix red dye with green dye and blue dye in the ratio 9 : 3 : 15 to make purple dye.

Josh uses 30 litres of green dye.

(b) How many litres of purple dye will Josh make with the 30 litres of green dye? Show a check of your working. **(5)**

Use the box below to show clearly how you get your answer.

Step 1: Identify ratio parts (red : green : blue = 9 : 3 : 15) *[M1 identify]*

Green dye is 3 parts = 30 litres

Step 2: Calculate the volume of 1 ratio part *[M1 1 part]*

1 part = 30 litres ÷ 3 = 10 litres

Step 3: Calculate total ratio parts for purple dye *[M1 total parts]*

Total parts = 9 (red) + 3 (green) + 15 (blue) = 27 parts

Step 4: Calculate total volume of purple dye *[M1 total dye]*

Purple Dye = 27 parts × 10 litres/part = 270 litres

Full component check:

- **Red dye = 9 parts × 10 L = 90 litres**
- **Green dye = 3 parts × 10 L = 30 litres**
- **Blue dye = 15 parts × 10 L = 150 litres**
- **Total = 90 + 30 + 150 = 270 litres [A1]**

Use the box below to show your check.

☑

Reverse check using green proportion: *[B1 check]*

Fraction of green = 3 / 27 = 1/9 of total mixture

Green dye = 270 L × (1/9) = 30 L (matches question!) (correct)

(Total for Question 4 is 8 marks)

DO NOT WRITE IN THIS AREA

DO NOT WRITE IN THIS AREA

5 Kirash works in the finance department of the company.
He has this information about prices of similar lamps.

lamp	A	B	C	D	E	F
price	£27.90	£25.50	£36.40	£29.60	£41.50	£33.80

Kirash needs to set the price for the lamp Josh designed.

He will set the price at $\frac{5}{4}$ of the median price of the six similar lamps.

What price should Kirash set for the lamp Josh designed?

(4)

Use the box below to show clearly how you get your answer.

Step 1: Arrange the six lamp prices in ascending order *[M1 order]*

Ordered: £25.50, £27.90, [£29.60, £33.80], £36.40, £41.50

Step 2: Calculate median price (mean of £29.60 & £33.80) *[M1 median]*

Median Price = (£29.60 + £33.80) ÷ 2 = £63.40 ÷ 2 = £31.70

Step 3: Calculate 5/4 of the median price (multiplier = 5 ÷ 4 = 1.25) *[M1 fraction]*

New Price = £31.70 × (5/4) = £31.70 × 1.25 = £39.625

Step 4: Round to standard money notation (2 decimal places / pence)

£39.625 rounds to £39.63 (standard money notation)

Reverse check:

- **£39.625 ÷ 1.25 = £31.70 (matches median exactly!) (correct)**

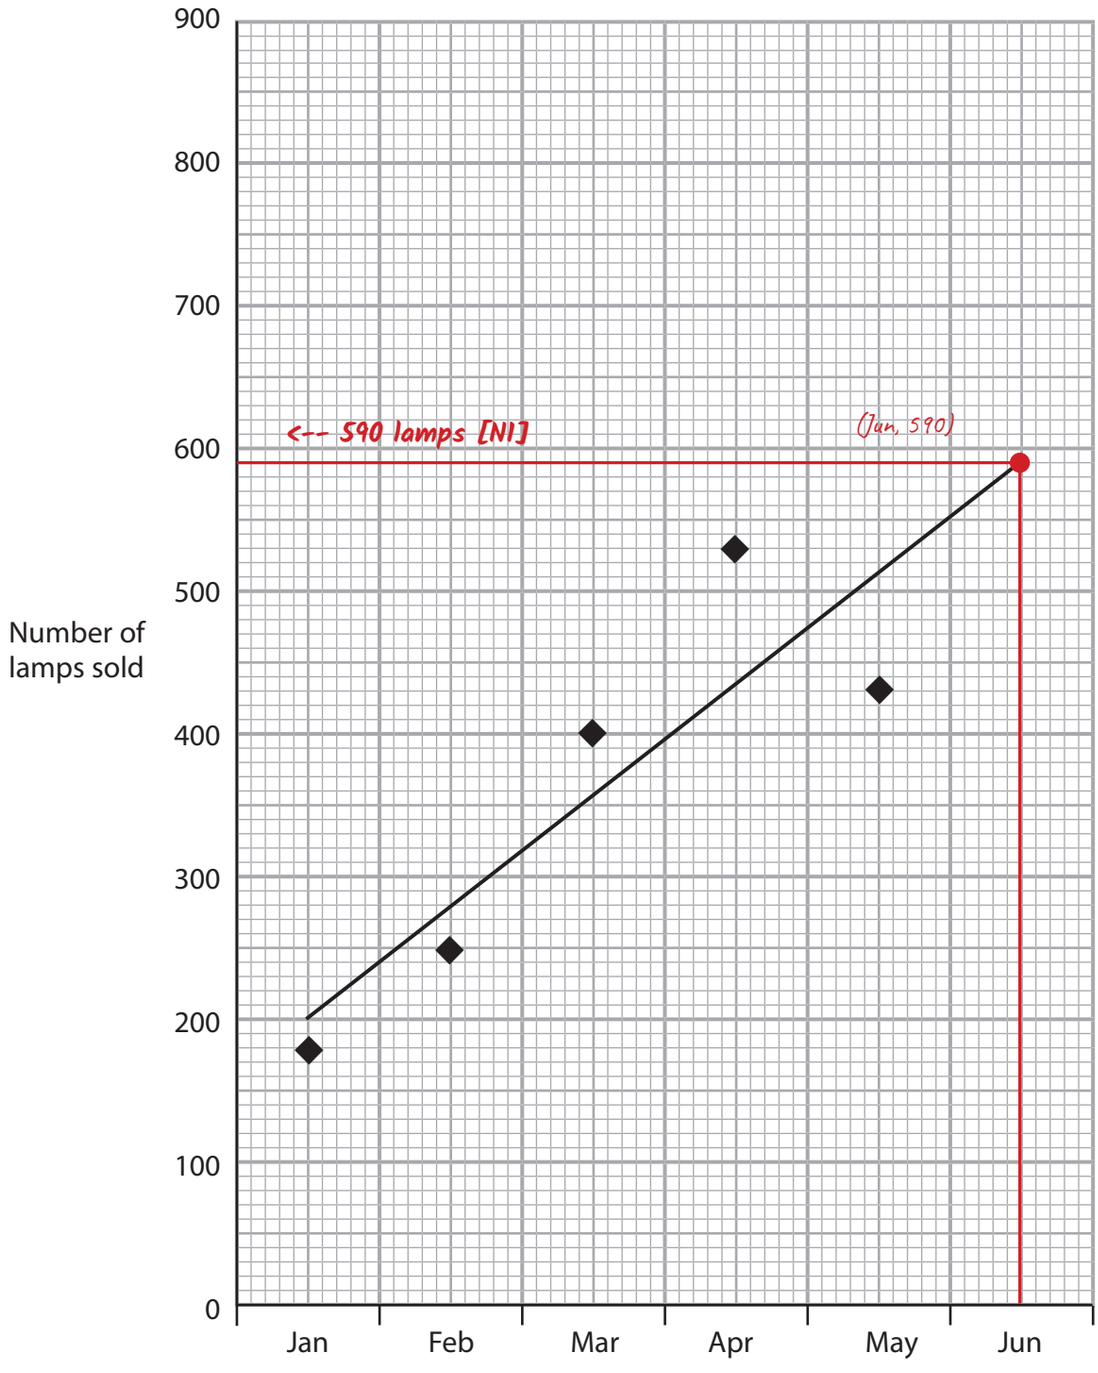

Price for Josh's Lamp = £39.63 *[A1]*

(Total for Question 5 is 4 marks)

6 Kirash begins to write a report about the number of lamps sold.

He draws this graph.

Kirash uses the trendline on this graph to predict the number of lamps that will be sold in June.

He knows that the profit for each lamp sold is £14.50

(a) Estimate the profit expected from the sale of lamps in June.

(3)

DO NOT WRITE IN THIS AREA
DO NOT WRITE IN THIS AREA
DO NOT WRITE IN THIS AREA

Use the box below to show clearly how you get your answer.

Step 1: Read the predicted number of lamps sold in June from the trendline *[M1 read]*

June Trendline reading = 590 lamps (range 580–600)

Step 2: Calculate total expected profit at £14.50 per lamp *[M1 profit]*

Expected Profit = 590 lamps × £14.50/lamp

Expected Profit = £8,555.00

Alternative values in allowed range:

- **At 580 lamps: 580 × £14.50 = £8,410.00**
- **At 600 lamps: 600 × £14.50 = £8,700.00**

Estimated Profit in June = £8,555.00 *[A1]*

(b) How suitable is this estimate?
Give a reason for your answer. **(1)**

Use the box below to write your answer.

Evaluation of estimate suitability: *[B1 comment]*

Suitable: The trendline demonstrates a clear, steady upward pattern in lamp sales across the consecutive 5 months from Jan to May.

Alternative valid answer: Not fully suitable because actual May sales fell slightly below trend, or daylight in summer may reduce lamp demand.

(Total for Question 6 is 4 marks)

DO NOT WRITE IN THIS AREA
DO NOT WRITE IN THIS AREA

SECTION C: Organising a run

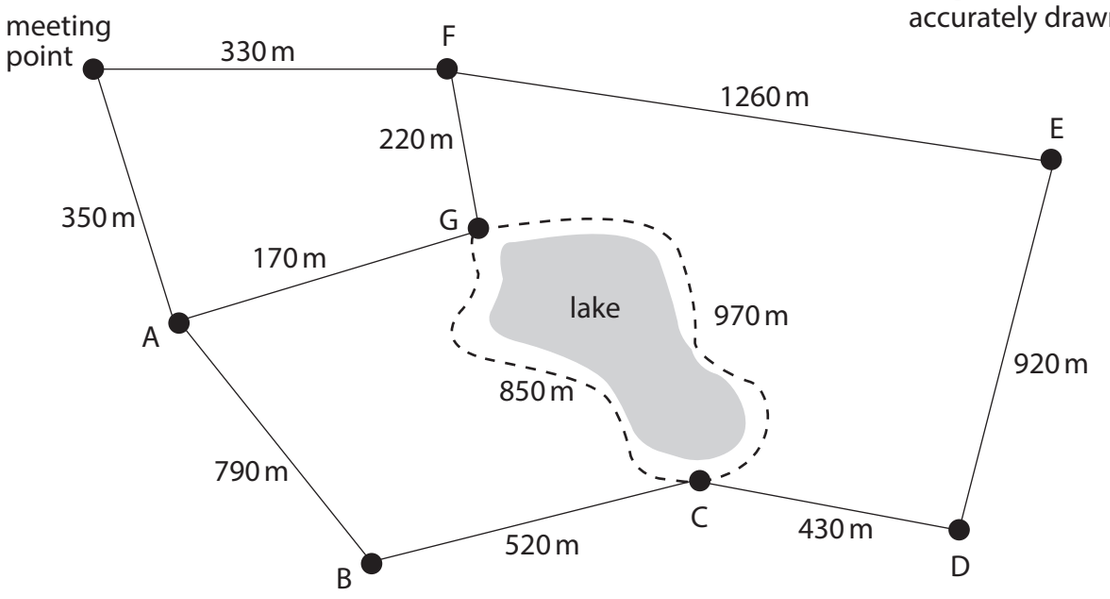

Answer all questions in this section.

Write your answers in the spaces provided.

7 Zara is the manager of a fitness club.
She organises a run in a park.
She needs to plan a route for the run.

Zara has this map of the park.

Diagram **not** accurately drawn

Key
- - - - - - - - - - lakeside path

Candidate Route: M -> F -> E -> D -> C -> lakeside -> B -> A -> M

Zara wants the route of the run to

- start and end at the meeting point
- go along the full length of the lakeside path
- go through point A
- have a total distance between 4 and 4.5 miles.

Zara knows that 5 miles is 8 km.

Plan a route for Zara.
Show the total distance of the route. **(6)**

(Full metric-to-miles conversion and route calculation shown on Page 15 -->)

DO NOT WRITE IN THIS AREA

DO NOT WRITE IN THIS AREA

DO NOT WRITE IN THIS AREA

Use the box below to show clearly how you get your answer.

Step 1: Convert target limits to metres (5 miles = 8 km) [M1 conversion]

- 4 miles = 4 × 1.6 = 6.4 km = 6,400 m (minimum distance)
- 4.5 miles = 4.5 × 1.6 = 7.2 km = 7,200 m (maximum distance)

Target Window: Route must measure between 6,400 m and 7,200 m

Step 2: Plan candidate route meeting all 4 conditions: [M1 route]

Route: Meeting Point (M) -> F -> E -> D -> C -> lakeside -> B -> A -> M

Step 3: Sum the segment distances in metres: [M1 sum]

- M to F = 330 m
- F to E = 1,260 m
- E to D = 920 m
- D to C = 430 m
- Lakeside path (around) = 970 m + 850 m + 520 m = 2,340 m
- B to A = 790 m
- A to M = 350 m

Total Distance = 330 + 1260 + 920 + 430 + 2340 + 790 + 350 = 6,420 m

Step 4: Convert total distance back to miles to verify:

6,420 m = 6.42 km --> 6.42 × (5 ÷ 8) = 4.0125 miles

4.0 miles ≤ 4.0125 miles ≤ 4.5 miles --> Condition met! (correct)

Planned Route: M -> F -> E -> D -> C -> lakeside -> B -> A -> M

Total Route Distance = 6,420 m (= 4.01 miles) [A1]

(Total for Question 7 is 6 marks)

DO NOT WRITE IN THIS AREA

8 Advertising in newspapers is charged by area.

Zara wants to advertise the run in a newspaper.
She will use a rectangular picture 105 mm by 148 mm.

To use the picture in the newspaper she needs to reduce its size.
She will use a scale factor of 0.8 to reduce the length of each side of the picture.

Work out the area of the picture that will appear in the newspaper.

(3)

Use the box below to show clearly how you get your answer.

Step 1: Calculate the reduced dimensions using scale factor 0.8 *[M1 scale]*

- Reduced width = 105 mm × 0.8 = 84 mm
- Reduced height = 148 mm × 0.8 = 118.4 mm

Step 2: Calculate the area of the reduced picture *[M1 area]*

Area = width × height = 84 mm × 118.4 mm

Area = 9,945.6 mm^2

Step 3: Verification using Area Scale Factor (linear scale factor squared):

- Original Area = 105 mm × 148 mm = 15,540 mm^2
- Area Scale Factor = $(0.8)^2$ = 0.64
- 15,540 mm^2 × 0.64 = 9,945.6 mm^2 (matches!) (correct)

Area of Reduced Picture = 9,945.6 mm^2 *[A1]*

(Total for Question 8 is 3 marks)

DO NOT WRITE IN THIS AREA

DO NOT WRITE IN THIS AREA

DO NOT WRITE IN THIS AREA

9 Zara needs to buy t-shirts to sell to people at the run.
She finds this offer for t-shirts

£4.79 per t-shirt

add a logo
£2.90 per t-shirt

buy more than 100 t-shirts each with a logo and get 15% off the total price

Zara wants to buy 130 t-shirts.
Each t-shirt will have a logo on it.

(a) How much will Zara pay in total for 130 t-shirts each with a logo?

(4)

Use the box below to show clearly your answer.

Step 1: Calculate normal price per single t-shirt with logo *[M1 unit cost]*

Unit Cost = £4.79 + £2.90 = £7.69 per t-shirt

Step 2: Calculate total cost for 130 t-shirts before discount *[M1 subtotal]*

Total Before Discount = 130 × £7.69 = £999.70

Step 3: Check discount eligibility (130 > 100) and apply 15% discount *[M1 discount]*

130 t-shirts > 100 t-shirts, so Zara qualifies for the 15% discount!

Discount = 15% of £999.70 = 0.15 × £999.70 = £149.955

Step 4: Calculate final discounted price and round to pence

Total = £999.70 − £149.955 = £849.745

Rounded to pence = £849.75

Or direct multiplier: £999.70 × 0.85 = £849.745 --> £849.75

Total Zara Will Pay = £849.75 *[A1]*
